SEASONS ORGANIC BIO-FERTILIZATION PROGRAM

Urban life is tough on trees. Our one-of-a-kind, customized SEASONS Organic Bio-fertilization Program can improve your soil quality, strengthen your trees and landscape plants, and extend their life span.

SEASONS: OUR YEAR-ROUND TREE HEALTH CARE PLAN

SEASONS ORGANIC BIO-FERTILIZATION PROGRAM BASE PROGRAM: 5 VISITS PER YEAR.

- Arborist Inspection: A certified arborist will visit your property once per year to do a full evaluation of your trees.
- Spring through Fall Applications: This program includes four applications of our SEASONS Liquid Bio-fertilizer solution by means of sub-surface root injections. Our liquid bio-fertilizer includes the full range of Soil Food Web micro-organisms, essential micro nutrients including over 75 different vitamins and minerals, plus critical high carbon-based soil conditioning products.
- Our SEASONS Liquid Bio-fertilizer enhances soil health and provides components for vigorous root development. It increases tolerance to many stress factors including disease, drought, insects and frost damage.

BOOST YOUR TREE’S HEALTH WITH THESE SEASONS UPGRADES:

- Soil Aeration and compost top dressing improves airflow around tree roots, reduces soil compaction and improves the function of your tree’s root system. Compost top dressing fills the aeration holes and works to change the soil’s ideal profile. This is the quickest way to develop sustainable soils that need very little attention over time. Other aeration methods using an airspade and backfilling with other products are often needed and recommended at the arborist’s direction.
- SEASONS Premium Program covers all your trees, lawn, and landscape plant health care needs while providing additional topical applications to your trees located in lawn areas by means of organic granular fertilizers and soil conditioners.
- Additional Property Reviews: We offer additional arborist inspections and consultations.

WHAT IS BIO-FERTILIZATION?

Bio-fertilization is the process that Mother Nature uses to fertilize plants in their natural habitat, without the use of harsh chemicals or synthetic fertilizers. As fallen leaves and other organic plant and animal matter begins to decompose and are broken down by microorganisms (microbes) in the soil, the nutrients they return to the earth nourish and strengthen the surrounding plants. When you feed the soil, it feeds your trees.

A NATURAL RELATIONSHIP

By digesting and decomposing organic matter, microbes within the complex Soil Food Web make nutrients available in the soil to be taken up by trees and other plants. Our Organic SEASONS Bio-fertilization Program stimulates and boosts this beneficial, symbiotic relationship.

Timely tree care tips and services at www.preservationtree.com
Our Soil Food Web (SFI) Certified, Soil Health Specialist carefully cultures beneficial soil microorganisms in our organic SEASONS Bio-fertilizer Solution. This solution is specifically engineered to emulate a forest soil microbial environment, which is ideal for optimal tree health as well as other plants in your landscape.

Our in-house lab runs an analysis on our SEASONS solution to ensure it contains the right species and quantity of beneficial microbes. This is critical, especially when applying the solution to different types of plants in your landscape.

When you remove one or more beneficial microbes from the Soil Food Web, natural soil nutrient cycling slows down or stops completely. The resulting stress on trees is often the first stage in their overall decline and it reduces their ability to fend off diseases and pests. Urban soils, which are typically compacted and lacking in organic matter, often don’t have sufficient microbial growth.

Couple the soil stress with the addition of over-applied harsh chemicals, synthetic fertilizers and pesticides, and you do more damage to the soil and your trees. Synthetic chemical products can deplete the soils of beneficial organisms as well as the non-beneficial ones – plus mask underlying issues.

We then inject the SEASONS Organic Bio-fertilizer solution directly into the soil at the plant’s root zone and let the organisms go to work to improve the soil and release nutrients. Under certain circumstances, we may choose to apply a soil drench or foliar application to your trees and plants.

Our SEASONS Premium Program, including all your trees, lawn and landscape plant health care needs, adds additional applications including our organic granular fertilizers and high carbon-based soil conditioning products to your lawn and trees located in lawn areas. The granular products are specifically engineered to emulate the organic matter naturally on the forest floor. Soil microbes break down the products, releasing important macro- and micro-nutrients into the soil to be taken up by trees and landscape plants. The combination of our liquid and granular bio-fertilizer products is extremely effective in achieving optimal plant health.
